

Notes from pdf

It describes the functions performed in particular layers by the popular set of network protocols - TCP and IP

ISO-OSI: it describes all stages of communication in various computer networks.

TCP/IP model	Protocols and Services	OSI model
Application	HTTP, FTP, Telnet NTP, DHCP, PING	Application Presentation
Transport	TCP, UDP	Session Transportation
Network	IP, ARP, ICMP, IGMP	Network
Network Interface	Ethernet	Data link Physical

	PDU	Address	Device	Protocol	Model TCP
Application				HTTP, DHCP	Application
Presentation				SMTP, DNS	
Session				POP, SSL	
Transport	Segment TCP Datagram UDP	Port number		TCP, UDP, SCTP	Transport
Network	Packet	IP address	Router	IPv4, IPv6 ICMP	Internet
Link layer	Frame	physical address MAC	Switch	ARP, Ethernet PPP, CDP	Network
Physical			Hub	Bluetooth, DSL SD-WAN	Access

PDU: protokol ver birimi. Çoğu katmanları arasında bilgi taşıyan veri paketleri.

Segment TCP: Verinin taşınması sırasında taşıma katmanında veriye eklenen başlık bilgisiyle birleşen bir veri pakettir.

Datagram UDP: Bağlantısız ve hızlı bir iletişim protokolü olan User Datagram Protocol (UDP) tarafından iletilen. Veri ifade eder.

Physical layer:

Physical layer is responsible for physical transport with network media in the form of a sequence of bits

- ⇒ Physical properties of the data carrier
- ⇒ Coding binary values in the medium (modulation)
- ⇒ It does not include ways of verifying data integrity
