

matrix

$$\begin{aligned}
 y &= ax + b && 2 \text{ points} \\
 y &= ax^2 + bx + c && 3 \text{ points} \\
 y &= ax^3 + bx^2 + cx + d && 4 \text{ points max} \\
 y &= ax^4 + bx^3 + cx^2 + dx + e && 5 \text{ points} \\
 y &= ax^5 + bx^4 + cx^3 + dx^2 + ex + f && 6 \text{ points} \\
 y &= ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g && 7 \text{ points}
 \end{aligned}
 \quad \left. \vphantom{\begin{aligned} y &= ax + b \\ y &= ax^2 + bx + c \\ y &= ax^3 + bx^2 + cx + d \\ y &= ax^4 + bx^3 + cx^2 + dx + e \\ y &= ax^5 + bx^4 + cx^3 + dx^2 + ex + f \\ y &= ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g \end{aligned}} \right\} \text{for start}$$

more or less algorithm

firstly
we have just 2 points

$$\begin{bmatrix} 0 & 1 & 0 & 5 & 1 & 1 & 1 & 5 & 1 & 2 & \dots & -1 & 3 & 5 \\ y_1 & y_2 & y_3 & y_4 & y_5 & \dots & y_6 & y_7 & y_8 & y_9 & \dots & y_{10} & y_{11} & y_{12} \end{bmatrix}$$

there should be
64 points

$$y = ax + b \rightarrow \text{put in the line on matrix}$$

when we have 3 points

$$\begin{array}{c|c|c} 2 & & x_3 \\ \hline & & y_3 \\ \hline \frac{1}{8} & \frac{1}{4} & \frac{1}{2} \end{array}$$

matrix
of
state
